| Soviet Cutbacks of Metals and Mineral Exports: An Update | |
| Summary | |
| In October 1984 we reported that the USSR had sharply reduced supplies to Western markets of selected minerals and strategic and precious metals in 1980-83 compared with export levels of the 1970s (see table 1). Moreover, we deduced that preliminary evidence indicated that Soviet sales of most of these commodities had been or may have been further reduced in 1984. This conclusion was based on incomplete trade statistics | |
| declines in 1984 of only 4 of the 11 raw materials for which trade statistics are available. Nevertheless, the more recent data reinforce our original judgment that the cutbacks for the 4 commodities and the lack of resurgence in exports of several other minerals and metals are part of a longer-term | 5X1 |
| general conclusion about sales of these commodities in 1903. | |
| Recent analysis supports our original hypothesis that multiple influencesrather than a comprehensive policywere responsible for the cutbacks. In particular, domestic production of | 5X1 |
| exports were reduced to close the gap. On the other hand, export availability | , |
| earnershas been primarily affected by soft market conditions and the Soviets' overall favorable trade position. Indeed, some of the earlier reports of expected cutbacks in 1984 may have been the result of Soviet 25X1 attempts to manipulate the markets. | |

1984 Revisited

In our original memorandum, we reported that exports to hard currency markets of selected minerals and strategic and precious metals fell in the early 1980s compared to levels of the 1970s and that deliveries declined even further in 1984. We could not establish, however, that the USSR had curbed exports as part of a comprehensive economic or military policy and we proposed several alternative explanations including (a) an improved hard currency position, (b) soft market prices in the West, (c) Soviet attempts to manipulate prices, (d) slower growth of domestic production, (e) increased domestic requirements, and (f) rising demand in other CEMA countries. Although exports of these commodities in 1984 generally remained well below sales in the 1970s, deliveries did not decline across the board

25X1

Recent reports and trade statistics indicate that exports to the West of several metals including aluminum, gold, and rhodium remained roughly constant in 1984 relative to 1983 levels, albeit well below sales in the 1970s. Indeed, exports of some items-platinum, palladium, iron ore, refined copper, and coal--rose from 1983 to 1984 (see table 2). On the other hand, exports of chromium ore and titanium fell to the lowest level since at least the 1960s.

2

25X1

We still do not believe the cutbacks observed since the 1970s are part of a single, comprehensive policy such as a stepup in a stockpiling program to deal with production bottlenecks or to enhance mobilization readiness. We believe our original hypothesis that multiple influences are involved remains valid. In particular, recent information suggests that domestic production of several minerals and metals has not met Soviet domestic or CEMA demand and that hard currency exports were reduced to close the gap. On the other hand, export availablity of gold, platinum, palladium and diamonds--all important hardcurrency earners--has been primarily affected by soft market conditions and the Soviets' overall favorable trade position. Exports of these commodities accounted for roughly 5 percent of Soviet hard currency earnings in 1983. The Soviets seem to set hard currency earnings targets, selling only enough to meet these 25X1 qoals.

A Review of Recent Evidence

We have not been able to detect any major changes in Soviet precious metals (gold and platinum group metals) export trends since late 1984. The volume of precious metals sales remains at a lower level than in the 1970s, but this is probably the result of the sharp improvement in the Soviet hard currency position since 1981 and relatively low prices in today's metals markets.
